Problem Set 3

Principles of Digital Communications Mar. 8, 2017

PROBLEM 1. Consider the ternary hypothesis testing problem

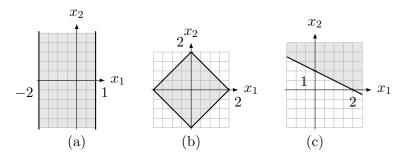

$$H_0: Y = c_0 + Z,$$
 $H_1: Y = c_1 + Z,$ $H_2: Y = c_2 + Z,$

where $Y = [Y_1, Y_2]^\mathsf{T}$ is the two-dimensional observation vector, $c_0 = \sqrt{\mathcal{E}}[1, 0]^\mathsf{T}$, $c_1 = \frac{1}{2}\sqrt{\mathcal{E}}[-1, \sqrt{3}]^\mathsf{T}$, $c_2 = \frac{1}{2}\sqrt{\mathcal{E}}[-1, -\sqrt{3}]^\mathsf{T}$, and $Z = [Z_1, Z_2]^\mathsf{T} \sim \mathcal{N}(0, \sigma^2 I_2)$.

- (a) Assuming the three hypotheses are equally likely, draw the optimal decision regions in the (Y_1, Y_2) plane.
- (b) Assume now that the apriori probabilities for the hypotheses are $\Pr\{H=0\}=\frac{1}{2}$, $\Pr\{H=1\}=\Pr\{H=2\}=\frac{1}{4}$. Draw the decision regions in the (L_1,L_2) plane where

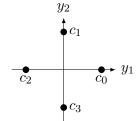

$$L_i := \frac{f_{Y|H}(Y|i)}{f_{Y|H}(Y|0)}, \quad i = 1, 2.$$

PROBLEM 2. Let $X \sim \mathcal{N}(0, \sigma^2 I_2)$. For each of the three diagrams shown below, express the probability that X lies in the shaded region. You may use the Q function when appropriate.

PROBLEM 3. Let $H \in \{0, 1, 2, 3\}$ as assume that when H = i you transmit the codeword c_i shown in the following diagram. Under H = i, the receiver observes $Y = c_i + Z$.

- (a) Draw the decoding regions assuming that $Z \sim \mathcal{N}(0, \sigma^2 I_2)$ and that $P_H(i) = 1/4, i \in \{0, 1, 2, 3\}.$
- (b) Draw the decoding regions (qualitatively) assuming $Z \sim \mathcal{N}(0, \sigma^2 I_2)$ and $P_H(0) = P_H(2) > P_H(1) = P_H(3)$. Justify your answer.

(c) Assume again that $P_H(i) = 1/4$, $i \in \{0, 1, 2, 3\}$ and that $Z \sim \mathcal{N}(0, K)$, where $K = \begin{pmatrix} \sigma^2 & 0 \\ 0 & 4\sigma^2 \end{pmatrix}$. How do you decode now?

PROBLEM 4. The following problem relates to the design of multi-antenna systems. Consider the binary equiprobable hypothesis testing problem:

$$H = 0: Y_1 = A + Z_1, \quad Y_2 = A + Z_2$$

 $H = 1: Y_1 = -A + Z_1, \quad Y_2 = -A + Z_2$

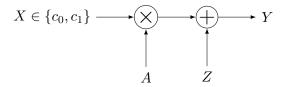

where Z_1 , Z_2 are independent Gaussian random variables with different variances $\sigma_1^2 \neq \sigma_2^2$, that is, $Z_1 \sim \mathcal{N}(0, \sigma_1^2)$ and $Z_2 \sim \mathcal{N}(0, \sigma_2^2)$. A > 0 is a constant.

(a) Show that the decision rule that minimizes the probability of error (based on the observable Y_1 and Y_2) can be stated as

$$\sigma_2^2 y_1 + \sigma_1^2 y_2 \overset{0}{\underset{1}{\gtrless}} 0$$

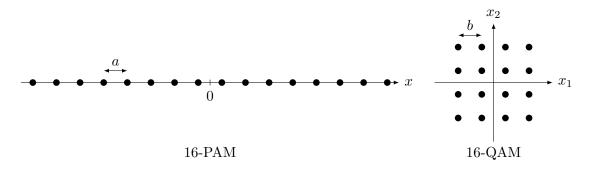

- (b) Draw the decision regions in the (Y_1, Y_2) plane for the special case where $\sigma_1 = 2\sigma_2$.
- (c) Evaluate the probability of the error for the optimal detector as a function of σ_1^2 , σ_2^2 and A.

PROBLEM 5. Consider the communication system depicted below. There are two equiprobable hypotheses. When H=0, we transmit $c_0=-b$, where b is an arbitrary but fixed positive number. When H=1, we transmit $c_1=b$. The channel is as shown in the diagram, where $Z \sim \mathcal{N}(0, \sigma^2)$ represents noise, $A \in \{0, 1\}$ represents a random attenuation (fading) with $P_A(0) = \frac{1}{2}$, and Y is the channel output. The random variables H, A, and Z are independent.

- (a) Find the decision rule that the receiver should implement to minimize the probability of error. Sketch the decision regions.
- (b) Calculate the probability of error P_e , based on the above decision rule.

PROBLEM 6. The following two signal constellations are used to communicate across an additive white Gaussian noise channel. Let the noise variance be σ_2 . Each point represents a codeword c_i for some i. Assume each codeword is used with the same probability.

- (a) For each signal constellation, compute the average probability of error P_e as a function of the parameters a and b, respectively.
- (b) For each signal constellation, compute the average energy per symbol $\mathcal E$ as a function of parameters a and b, respectively:

2

$$\mathcal{E} = \sum_{i=1}^{16} P_H(i) ||c_i||^2$$

(c) Plot P_e versus $\frac{\mathcal{E}}{\sigma^2}$ for both signal constellations and comment.
